## 1 Overview

This document describes the Authorization Public Key Eclipse Arrowhead service, which enables clients to get the public key of the Authorization Core System. Examples of this interaction is a system that wants to check the public key of the Authorization Core System.

The rest of this document is organized as follows. In Section 2, we describe the abstract message functions provided by the service. In Section 3, we end the document by presenting the data types used by the mentioned functions.

## 2 Service Interfaces

This section lists the functions that must be exposed by the Public Key service in alphabetical order. In particular, each subsection names an abstract interface, an input type and an output type, in that order. The input type is named inside parentheses, while the output type is preceded by a colon. Input and output types are only denoted when accepted or returned, respectively, by the interface in question.

All abstract data types named in this section are defined in Section 3.

### 2.1 function **Publickey** (**Publickey**)

The Publickey function returns the Authorization Core Systems public key in *String* format.

## 3 Information Model

Here, all data objects that can be part of PublicKey service calls are listed in alphabetic order. Note that each subsection, which describes one type of object, begins with the *struct* keyword, which is used to denote a collection of named fields, each with its own data type. As a complement to the explicitly defined types in this section, there is also a list of implicit primitive types in Section 3.1, which are used to represent things like hashes and identifiers.

### 3.1 Primitives

Types and structures mentioned throughout this document that are assumed to be available to implementations of this service. The concrete interpretations of each of these types and structures must be provided by any IDD document claiming to implement this service.

Type	Description
String	Simple text
